the symposium aimed at analysing and solving the various problems of representation and analysis of decision making in economic systems starting from the level of the individual firm and ending up with the complexities of international policy coordination the papers are grouped into subject areas such as game theory control methods international policy coordination and the applications of artificial intelligence and experts systems as a framework in economic modelling and control the symposium therefore provides a wide range of important information for those involved or interested in the planning of company and national economics

this book is devoted to the econometric analysis of linear multivariate rational expectation models it shows that the interpretation of multiplicity in terms of new degrees of freedom is consistent with a rigorous econometric reasoning non uniqueness is the central theme of this book each chapter is concerned with a specific econometric aspect of rational expectations equilibria the most constructive result lies in the possibility of an empirical determination of the equilibrium followed by the economy

many methods have been proposed for the solution and simulation of medium or large size models under the assumption of rational expectations the purpose of this paper is to present these methods and to show how and where each can be applied the methods fall into two groups methods in the first can be used to solve for perfect foresight paths in non linear models methods in the second can be used in linear models to solve either for paths or processes followed by endogenous variables all the methods described here have been used in empirical applications and computer algorithms are available for most

this book surveys the theories techniques model building and data collection and applications of econometrics key topics it focuses on those aspects of econometrics that are of major importance to readers and researchers interested in performing evaluating or understanding econometric studies in a variety of areas it reviews matrix notation and the use of multivariate statistics discusses the specification of the model and the development of data for its estimation covers recent developments in econometric models techniques and applications explains the estimation of single equation models and provides case studies of the applications of econometrics to a wide array of areas including traditional areas such as the estimation of demand functions and production functions and macroeconomic models
